I Single-Period Portfolio Choice and Asset Pricing 1

1 Expected Utility and Risk Aversion 3
  1.1 Preferences when Returns Are Uncertain . . . . . . . . . . 4
  1.2 Risk Aversion and Risk Premia . . . . . . . . . . . . . . 14
  1.3 Risk Aversion and Portfolio Choice . . . . . . . . . . . . 25
  1.4 Summary . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 33
  1.5 Exercises . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 34

2 Mean-Variance Analysis 37
  2.1 Assumptions on Preferences and Asset Returns . . . . . . . 39
  2.2 Investor Indifference Relations . . . . . . . . . . . . . . . . . 43
  2.3 The Efficient Frontier . . . . . . . . . . . . . . . . . . . . . . 46
    2.3.1 A Simple Example . . . . . . . . . . . . . . . . . . . . 47
    2.3.2 Mathematics of the Efficient Frontier . . . . . . . . . 51
    2.3.3 Portfolio Separation . . . . . . . . . . . . . . . . . . . 56
  2.4 The Efficient Frontier with a Riskless Asset . . . . . . . . 59
    2.4.1 An Example with Negative Exponential Utility . . . . 65
CONTENTS

2.5 An Application to Cross-Hedging .................................. 68
2.6 Summary ............................................................... 72
2.7 Exercises ............................................................. 72

3 CAPM, Arbitrage, and Linear Factor Models .................... 77
3.1 The Capital Asset Pricing Model ................................. 79
  3.1.1 Characteristics of the Tangency Portfolio ................... 80
  3.1.2 Market Equilibrium ............................................. 82
3.2 Arbitrage ............................................................. 89
  3.2.1 Examples of Arbitrage Pricing ............................... 91

CONTENTS

II Multiperiod Consumption, Portfolio Choice, and Asset Pricing

5 A Multiperiod Discrete-Time Model

5.1 Assumptions and Notation of the Model

5.1.1 Preferences

5.1.2 The Dynamics of Wealth

5.2 Solving the Multiperiod Model

5.2.1 The Final Period Solution

5.2.2 Deriving the Bellman Equation

5.2.3 The General Solution

5.3 Example Using Log Utility

5.4 Summary

5.5 Exercises

6 Multiperiod Market Equilibrium

6.1 Asset Pricing in the Multiperiod Model

6.1.1 The Multi-Period Pricing Kernel

6.2 The Lucas Model of Asset Pricing

6.2.1 Including Dividends in Asset Returns

6.2.2 Equating Dividends to Consumption

6.2.3 Asset Pricing Examples

6.2.4 A Lucas Model with Labor Income

6.3 Rational Asset Price Bubbles

6.3.1 Examples of Bubble Solutions

6.3.2 The Likelihood of Rational Bubbles
CONTENTS

6.4 Summary ............ 187
6.5 Exercises ............ 188

III Contingent Claims Pricing 191

7 Basics of Derivative Pricing 193
7.1 Forward and Option Contracts .... 194
   7.1.1 Forward Contracts on Assets Paying Dividends ... 195
   7.1.2 Basic Characteristics of Option Prices .... 198
7.2 Binomial Option Pricing ........... 203
   7.2.1 Valuing a One-Period Option ........... 205
   7.2.2 Valuing a Multiperiod Option ........... 209
7.3 Binomial Model Applications .......... 213
   7.3.1 Calibrating the Model ........... 215
   7.3.2 Valuing an American Option .......... 217
   7.3.3 Options on Dividend-Paying Assets .......... 223
7.4 Summary ........... 224
7.5 Exercises ........... 225

8 Diffusion Processes and Itô’s Lemma 229
8.1 Pure Brownian Motion ........... 231
   8.1.1 The Continuous-Time Limit ........... 232
8.2 Diffusion Processes ........... 235
   8.2.1 Definition of an Itô Integral ........... 236
8.3 Itô’s Lemma ........... 238
   8.3.1 Geometric Brownian Motion ........... 241
   8.3.2 Kolmogorov Equation ........... 242
## CONTENTS

8.3.3 Multivariate Diffusions and Itô's Lemma ............... 245
8.4 Summary ............................................. 247

8.5 Exercises ............................................. 247

9 Dynamic Hedging and PDE Valuation ...................... 251

9.1 Black-Scholes Option Pricing .......................... 252
  9.1.1 Portfolio Dynamics in Continuous Time ............. 253
  9.1.2 Black-Scholes Model Assumptions .................. 257
  9.1.3 The Hedge Portfolio ............................ 258
  9.1.4 No-Arbitrage Implies a PDE ..................... 260

9.2 An Equilibrium Term Structure Model ................. 263
  9.2.1 A Bond Risk Premium .......................... 266
  9.2.2 Characteristics of Bond Prices .................. 268

9.3 Option Pricing with Random Interest Rates ............ 270

9.4 Summary ............................................. 275

9.5 Exercises ............................................. 276

10 Arbitrage, Martingales, Pricing Kernels ............... 279

10.1 Arbitrage and Martingales .......................... 281
  10.1.1 A Change in Probability: Girsanov's Theorem ........ 283
  10.1.2 Money Market Deflator ........................ 286
  10.1.3 Feynman-Kac Solution ........................ 287

10.2 Arbitrage and Pricing Kernels ....................... 288
  10.2.1 Linking the Valuation Methods ................ 291
  10.2.2 The Multivariate Case ......................... 293

10.3 Alternative Price Deflators ........................ 294
10.4 Applications ....................................................... 297
  10.4.1 Continuous Dividends ....................................... 297
  10.4.2 The Term Structure Revisited .............................. 303
10.5 Summary .......................................................... 305
10.6 Exercises .......................................................... 306

11 Mixing Diffusion and Jump Processes 311
  11.1 Modeling Jumps in Continuous Time ......................... 312
  11.2 Itô’s Lemma for Jump-Diffusion Processes ................. 314
  11.3 Valuing Contingent Claims .................................... 316
    11.3.1 An Imperfect Hedge ...................................... 317
    11.3.2 Diversifiable Jump Risk .................................. 319
    11.3.3 Lognormal Jump Proportions ............................. 321
    11.3.4 Nondiversifiable Jump Risk ............................... 323
    11.3.5 Black-Scholes versus Jump-Diffusion Model .......... 323
  11.4 Summary ......................................................... 326
  11.5 Exercises ........................................................ 327

IV Asset Pricing in Continuous Time 329

12 Continuous Time Portfolio Choice 331
  12.1 Model Assumptions .............................................. 333
  12.2 Continuous-Time Dynamic Programming ..................... 335
  12.3 Solving the Continuous-Time Problem ....................... 338
    12.3.1 Constant Investment Opportunities ..................... 340
    12.3.2 Changing Investment Opportunities ..................... 347
  12.4 The Martingale Approach ...................................... 355
# CONTENTS

12.4.1 Market Completeness Assumptions .................................. 356
12.4.2 The Optimal Consumption Plan ..................................... 357
12.4.3 The Portfolio Allocation ............................................. 362
12.4.4 An Example .............................................................. 363

12.5 Summary ................................................................. 368
12.6 Exercises ................................................................. 369

13 Equilibrium Asset Returns ................................................. 379

13.1 An Intertemporal Capital Asset Pricing Model ....................... 380
  13.1.1 Constant Investment Opportunities .............................. 381

13.1.2 Stochastic Investment Opportunities .............................. 383
13.1.3 An Extension to State-Dependent Utility ......................... 386
13.2 Breeden’s Consumption CAPM ......................................... 387
13.3 A Cox, Ingersoll, and Ross Production Economy .................... 391
  13.3.1 An Example Using Log Utility .................................... 399
13.4 Summary ................................................................. 404
13.5 Exercises ................................................................. 404

14 Time-Inseparable Utility ..................................................... 409

14.1 Constantinides’ Internal Habit Model .................................. 411
  14.1.1 Assumptions ......................................................... 411
  14.1.2 Consumption and Portfolio Choices .............................. 416
14.2 Campbell and Cochrane’s External Habit Model ..................... 421
  14.2.1 Assumptions ......................................................... 421
  14.2.2 Equilibrium Asset Prices ........................................ 423
14.3 Recursive Utility ........................................................ 426
  14.3.1 A Model by Obstfeld ............................................. 427
14.3.2 Discussion of the Model 433
14.4 Summary 436
14.5 Exercises 437

V Additional Topics in Asset Pricing 441

15 Behavioral Finance and Asset Pricing 443

15.1 The Effects of Psychological Biases on Asset Prices 446
  15.1.1 Assumptions 446
  15.1.2 Solving the Model 450
  15.1.3 Model Results 454
15.2 The Impact of Irrational Traders on Asset Prices 455
  15.2.1 Assumptions 455
  15.2.2 Solution Technique 457
  15.2.3 Analysis of the Results 462
15.3 Summary 470
15.4 Exercises 471

16 Asset Pricing with Differential Information 473

16.1 Equilibrium with Private Information 474
  16.1.1 Grossman Model Assumptions 475
  16.1.2 Individuals’ Asset Demands 476
  16.1.3 A Competitive Equilibrium 477
  16.1.4 A Rational Expectations Equilibrium 478
  16.1.5 A Noisy Rational Expectations Equilibrium 481
16.2 Asymmetric Information 485
16.2.1 Kyle Model Assumptions . . . . . . . . . . . . . . . . . . 486
16.2.2 Trading and Pricing Strategies . . . . . . . . . . . . . . . 487
16.2.3 Analysis of the Results . . . . . . . . . . . . . . . . . . . . 491
16.3 Summary . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 494
16.4 Exercises . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 494

17 Term Structure Models 499
17.1 Equilibrium Term Structure Models . . . . . . . . . . . . . . . 500
17.1.1 Affine Models . . . . . . . . . . . . . . . . . . . . . . . . . 503
17.1.2 Quadratic Gaussian Models . . . . . . . . . . . . . . . . . 509

18.3 Summary ........................................... 567

18.4 Exercises ........................................... 568
Preface

The genesis of this book comes from my experience teaching asset pricing theory to beginning doctoral students in finance and economics. What I found was that no existing text included all of the major theories and techniques of asset valuation that students studying for a Ph.D. in financial economics should know. While there are many excellent books in this area, none seemed ideal as a stand-alone text for a one-semester first course in theoretical asset pricing. My choice of this book’s topics were those that I believe are most valuable to someone at the start of a career in financial research. Probably the two features that most distinguish this book from others are its broad coverage and its user-friendliness.

Contents of this book have been used for over a decade in introductory finance theory courses presented to doctoral students and advanced masters students at the University of Illinois at Urbana-Champaign. The book presumes students have a background in mathematical probability and statistics and that they are familiar with constrained maximization (Lagrange multiplier) problems. A prior course in microeconomics at the graduate or advanced undergraduate level would be helpful preparation for a course based on this book. However, I have found that doctoral students from mathematics, engineering, and the physical sciences who had little prior knowledge of economics often are able to understand the course material.
This book covers theories of asset pricing that are the foundation of current theoretical and empirical research in financial economics. It analyzes models of individual consumption and portfolio choice and their implications for equilibrium asset prices. In addition, contingent claims valuation techniques based on the absence of arbitrage are presented. Most of the consumption-portfolio choice models assume individuals have standard, time-separable expected utility functions, but the book also considers more recent models of utility that are not time separable or that incorporate behavioral biases. Further, while much of the analysis makes standard “perfect markets” assumptions, the book also examines the impact of asymmetric information on trading and asset prices. Many of the later chapters build on earlier ones, and important topics reoccur as models of increasing complexity are introduced to address them. Both discrete-time and continuous-time models are presented in a manner that attempts to be intuitive, easy to follow, and that avoids excessive formalism.

As its title makes clear, this book focuses on theory. While it sometimes contains brief remarks on whether a particular theory has been successful in explaining empirical findings, I expect that doctoral students will have additional exposure to an empirical investments seminar. Some of the material in the book may be skipped if time is limited to a one-semester course. For example, parts of Chapter 7’s coverage of binomial option pricing may be cut if students have seen this material in a masters-level derivatives course. Any or all of the chapters in Section V also may be omitted. In my teaching, I cover Chapter 15 on behavioral finance and asset pricing, in part because current research on this topic is expanding rapidly. However, if reviewer response is any indication, there are strongly held opinions about behavioral finance and asset pricing, and so I suspect some readers will choose to skip this material all together while others may wish to see it expanded.
Typically, I also cover Chapter 16 which outlines some of the important models of asymmetric information that I believe all doctoral students should know. However, many Ph.D. programs may offer a course entirely devoted to this topic, so that this material could be deleted under that circumstance. Chapters 17 and 18 on modeling default-free and defaultable bond prices contain advanced material that I typically do not have time to cover during a single semester. Still, there is a vast amount of research on default-free term structure models and a growing interest in modeling default risk. Thus, in response to reviewers’ suggestions, I have included this material because some may find coverage of these topics helpful for their future research. A final note on the end of chapter problems: most of these problems derive from assignments and exams given to my students at the University of Illinois. The solutions are available for instructor download at the Addison Wesley website.

Acknowledgements

I owe a debt to the individuals who first sparked my interest in financial economics. I was lucky to have been a graduate student at MIT during the early 1980s where I could absorb the insights of great financial economists, including Fischer Black, Stanley Fischer, Robert Merton, Franco Modigliani, Stewart Myers, and Paul Samuelson. Also, I am grateful to my former colleague at Wharton, Alessandro Penati, who first encouraged the writing of this book when we team taught a finance theory course at Università Bocconi during the mid-1990s. He contributed notes on some of the book’s beginning chapters.

Many thanks are due to my colleagues and students at the University of Illinois who provided comments and corrections to the manuscript. In addition, I have profited from the valuable suggestions of many individuals from other universities who reviewed drafts of some chapters. I am particularly indebted to the following individuals who provided extensive comments on parts of the book:

The level of support that I received from the staff at Addison-Wesley greatly exceeded my initial expectations. Writing a book of this scope was a time-consuming process that was made manageable with their valuable assistance. Senior Acquisitions Editor Donna Battista deserves very special thanks for her encouragement and suggestions.

Last but not least my wife Peggy and our triplets George, Laura, and Sally deserve recognition for the love and patience they have shown to me. Their enthusiasm buoyed my spirits and helped bring this project to fruition.
This note introduces asset pricing theory to Ph.D. students in finance. The emphasis is put on dynamic asset pricing models that are built on continuous-time stochastic processes. It is very preliminary. Please let me know if you discover any mistake. 

Preface. i. 1

Introduction to Asset Pricing Theory. 1. 1.1 Basic Abstractions. . This article compares two leading models of asset pricing: the capital asset pricing model (CAPM) and the arbitrage pricing theory (APT). I argue that while the APT is compatible with the data available for testing theories of asset pricing, the CAPM is not. In reaching this conclusion emphasis is placed on the distinction between the unconditional (relatively incomplete) information which econometricians must use to estimate asset pricing models and the conditional (complete) information which investors use in making the portfolio decisions which determine asset prices. In finance, arbitrage pricing theory (APT) is a general theory of asset pricing that holds that the expected return of a financial asset can be modeled as a linear function of various factors or theoretical market indices, where sensitivity to changes in each factor is represented by a factor-specific beta coefficient. The model-derived rate of return will then be used to price the asset correctly—the asset price should equal the expected end of period price discounted at the rate implied by the model theory of asset pricing and portfolio management in the discrete time case. Consider the current time t. Let et be the consumption level (if the investor bought none of the asset) and denote by ξ the amount of a certain kind of asset he chooses to buy with a price of pt per unit. Here the asset can be bonds, stocks, or options, etc.

230 chapter 10. Asset pricing theory. Under this probability measure, we can write the price form as:

\[ p_t = E_t [m_{t+1} (1 + r_t) X_{t+1}] . \]
