Contents

1. Introduction and Terminology

History
Terminology

2. The Medium

Properties of Gases
Properties of Liquids and Solids
Solutions to Wave Equations
Attenuation of Sound in Air
Attenuation of Sound in Water
Sound Propagation Outdoors

3. Disturbance of Plane Sound Waves by Obstacles and by Finite Baffles

Disturbance by Spheres and Cylinders
Disturbance by Circular Disks and Screens
Diffraction Around Human Body
Sources in Finite Baffles

4. Primary Techniques for Measurement of Sound Pressure and Particle Velocity and the Absolute Calibration of Microphones

Reciprocity Technique of Calibration
Particle Velocity--Rayleigh Disk
Particle Amplitude
Thermophone Source
Pistonphone Source
Electrostatic Actuator

5. Microphones and Ears

Microphones in Sound Fields
Self-Noise of Microphones
The Ear
Carbon Microphone
Condenser Microphone
Electret Prepolarized Microphone
Moving Coil (Dynamic) Microphone
Ribbon Microphone
Piezoelectric Microphones
Directional Microphones
Microphones in Winds (Wind Screens)
Sound Intensity Measurement

6. Signal Generators and the Measurement of Frequency

Primary Frequency Standards
Secondary Frequency Standards
Musicians' Frequency Standards
Frequency Meters
Frequency by Comparison
Beat-Frequency Oscillator

7. Measurement of Acoustic Impedance

Types of Impedance
Transmission Line Methods

Surface Methods
Bridges
Variable Acoustic Impedance
Reaction on the Source

8. The Audiometer

Pure Tone Audiometers
Standard Reference Thresholds
9-A Earphone Coupler
Bone Conduction Vibrator
Artificial Mastoid
Speech Audiometers
Rooms for Audiometry

9. Sound Sources for Test Purposes

Human Voice
Artificial Voices
Loudspeakers
Earphones
Air-Flow Loudspeakers
Longitudinally Vibrating Rods
Sirens
Explosive Sources
Resonant Enclosures
Whistles

10. Characteristics of Random Noise and the Response of Rectifiers

Statistical Properties of Random Noise
Peak Indicating Rectifier Circuits
Average Indicating Rectifier Circuits
Biased and Saturated Rectifiers

11. Indicating and Integrating Instruments for the Measurement of Complex Waves

Peak Meters
Average Meters
Root-Mean-Square Meters
Graphic Level Recorder
VU Meter
Grassot Fluxmeter
Vacuum Thermocouple
Tests of Indicating Instruments

12. Analysis of Sound Waves

Heterodyne-Type Analyzer
Constant-Percentage Bandwidth Analyzer
Contiguous-Band Analyzer
Table of Pitch (Mels) vs. Frequency
Calculation of Loudness
Mechanical Resonance Analyzer
Henrici Mechanical Analyzer
Optical Analyzer
Analysis of Transient Sounds
Errors Owing to Rate of Sweep Frequency

Contiguous-Band Analyzers
Loop Recording Analyzer
Acoustic Diffraction Grating
Visible Speech Analyzer
Calibration of Sound Analyzers (Filters)
Conversion from One Band Width to Another
Inadequate Attenuation in Non-Pass Band
Presentation of Data

13. Basic Tests for Communication Systems and Rating of Microphones, Amplifiers and Loudspeakers

Microphone and Amplifier Response
Loudspeaker or Earphone Response
Overall System Response
Orthotelephone Response
Repetition Count
Articulation Tests
Speech Transmission, RASTI, Meter

14. Tests for Laboratory and Studio Microphones

Frequency Response Characteristic
Directivity
Power Efficiency
Non-Linear Distortion
Electrical Impedance
Transient Response
Dynamic Range

15. Tests for Loudspeakers

Frequency Response Characteristic
Directivity
Power Efficiency
Non-Linear Distortion
Electrical Impedance
Power-Handling Capacity
Transient Response
Loudness Efficiency Rating

16. Testing of Communication System Components

Real-Voice Testing of Microphones
Artificial-Voice Testing of Microphones
Real-Ear Testing of Earphones
Characteristics of Probe Tubes
Artificial Ear (Coupler) Testing of Earphones

Ear Cushion Attenuation
Hearing Aid Measurements

17. Articulation Test Methods

Testing Crew Selection and Training
Syllable, Word and Sentence Lists
Analysis of Test Data
Simplified Articulation Test

18. Measurement of the Acoustic Properties of Rooms, Studios, and Auditoriums

Reverberation Time
Initial-Time-Delay Gap and Succeeding Pattern of Early Reflections
Auto- and Cross-Correlation Techniques
Measurement of Speech Intelligibility
Speech Transmission, RASTI Meter

19. Measurement of Noise Sources, Noise in Buildings, and Materials and Structures Noise Control

Introductory Remarks
Books Related to Noise Measurements
Standards for Noise Measurement Methods
Standards for Measurement of Noise from Specific Sources
Standards for Measurement of Structures and Materials for Noise Control

20. Sound Level Meter

Introduction
Definitions, American Standard
General Characteristics
Types of Sound Level Meter
Microphone and Instrument Case Response
Frequency Weighting and Amplifier Characteristics
Exponential-Time Averaging-Characteristics
Other Specifications and Tests
Characteristics of Octave- and One-Third-Octave Band Filter Sets
Integrating Characteristics of Meters
Techniques, Precautions and Calibration
Effects of Meter Case and Person Holding Instrument

Appendix: Bibliography for Further Study
Subject Index

Preface to Original Edition

This book is intended primarily as a reference for graduate students and workers in the field of acoustics. I have attempted to cover the subject of acoustic measurements in such a way that the book will be an aid to five main groups of research workers: the acoustic physicist making fundamental laboratory measurements, the communications engineer measuring and evaluating the performance of audio communication systems, the psychologist performing measurements involving the human hearing mechanism, the otologist studying hearing defects, and, finally, the industrialist applying acoustic measuring techniques in manufacturing processes.

Acoustic measurements are sufficiently complex to require a knowledge of the fundamental factors involved in any given measurement and of the various apparatuses that will perform the measurement. This book gives the mathematical equations underlying each type of acoustic measurement; it describes and compares the relative advantages and disadvantages of alternative apparatuses. The resultant text is somewhat longer than that originally contemplated, but it is hoped that the increase in reading matter will effect a net saving in time for the experimenter.

I wish to express my indebtedness to many of my colleagues and fellow workers in the field of acoustics whose aid has been invaluable both in obtaining material and in reading and criticizing the manuscript. I am especially grateful to Dr. R.H. Nichols, Jr., of the Bell Telephone Laboratories, who, in addition to preparing the text for Chapters 8 and 14, devoted much time to editing and correcting the manuscript. Dr. James P. Egan of the University of Wisconsin gave kind permission to use material from one of his reports in Chapter 17.

I also wish to thank Clare Twardzik, who prepared the illustrations; Elizabeth H. Jones, who gave valuable assistance in editing the manuscript; and Mr. Wilmer Bartholomew, who gave valuable assistance in editing the final manuscript.

The entire project was made possible through funds supplied by the Office of Naval Research, Navy Department, Washington, D.C., under Contract No. N7onr-313. In particular, I wish to acknowledge the assistance of Dr. Alan Waterman and Mr. Wilbert Annis in arranging for the contract and in supplying me with information from the documentary files of the Office of Naval Research.

Finally, I am grateful to my wife, Phyllis Knight Beranek, who assisted in the reading of the galley and page proof and who helped in many other ways.

I am aware that, in spite of every effort to the contrary, there will be errors in the following pages. I assume responsibility for them, and I trust that my readers will be kind enough to point them out.

Cambridge, Massachusetts March, 1919

Preface to Revised Edition

Forty years have passed since the manuscript for the first edition of *Acoustic Measurements* was completed. That era coincided with a vigorous expansion of theory, experiment, education, applications, and government support of acoustics throughout the world. The annual number of pages published in the Journal of the Acoustical Society of America has increased five-fold since 1948. Ten technical periodicals in the field, compared to one, are found in our libraries. Important acoustical research laboratories have been established in nearly every industrial country.

In the first edition, little space was devoted to the sound level meter, today's most basic sound measuring instrument. The sound level meter of the 1940s was usually equipped with a Rochelle salt crystal microphone, which was grossly sensitive to temperature and dissolved in high humidity and high temperature. Calibration of a sound level meter, even years after purchase, was seldom made and the user needed a strong back or a rolling table while taking data.

Analyzers were primarily laboratory research instruments and no high-fidelity apparatus for recording sound, except the optical track on movie film, was commercially available.

Nevertheless, one acoustical measurement device has, like the Rock of Gibraltar, stood unchanged since those days, namely, the National Bureau of Standards Type 9A coupler for measuring audiometric earphones. Other measuring equipment that have prevailed are condenser microphones, apparatus for reciprocity calibration of them, and graphic level recorders of the moving-coil-actuated type.

Today's sound and vibration level meters, analyzers, recorders, and computers are a triumph of solid-state electronics which permit a variety of accurate measurement functions. Microphones, vibration pickups and their associated amplifiers are highly stable and suited to widely varying ambient conditions. Sound, noise, and vibration generators assist every class of field and laboratory measurement. Recently, the intensity meter, which measures acoustic energy flow in any direction in complex noise fields, has come into use.

This revised edition of the original *Acoustic Measurements* attempts to cover many of these developments. Primarily owing to the lack of space, it does not deal with the design of digital equipment or with digital computer programs. References to these are given in the Appendix. The engineer must understand the basic physical laws of analog filters and signal processors to use digital equipment intelligently because both obey the same rules.

Over one-half of the pages in this edition are new, and twelve of the twenty chapters have been rewritten or revised in major ways. No attempt has been made to update the "History" section, mainly because of lack of time. Some of the more interesting earlier methods of sound measurement have been retained to illustrate the range of possibilities.

I wish to thank colleagues and equipment manufacturers who helped me with concepts and furnished me with drawings. My appreciation extends to Mary M. Smith in the Art Department of Bolt Beranek and Newman, Inc., for preparing many of the illustrations. It is my hope that the revised and renamed *Acoustical Measurements* will justify the confidence that the Acoustical Society of America has shown in producing a new edition.

Precision Acoustics is pleased to offer access to a full range of acoustic measurement services for medical and non medical ultrasound transducers. The accurate characterisation of temporal and spatial parameters of a medical ultrasonic field is important for safety reasons. Using our fully automated test tanks, Precision Acoustics can measure the parameters required by international safety standards and regulatory organisations in the frequency range 0.5-20MHz. Acoustical measurements and instrumentation

Analysis of sound and acoustics plays a role in such engineering tasks as product design, production test, machine performance, and process control. For instance, product design can require modification of sound level or noise for compliance with standards from ANSI, IEC, and ISO. The work might also involve design fine-tuning to meet market expectations. Here, examples include tweaking an automobile door latching mechanism to impress a consumer with a satisfying click or modifying an exhaust manifold
